

Please Note:

Sw = OL/CL switch

t = Timer (This is reset every new state)

Cf = Charge Flag

I = Total current going through battery

ΔI = Change in current during MPPT

V_{Cell} = Single Cell voltage

V_{Tot} = Total battery voltage

ERROR = $(V > 3.7V \parallel V < 2.3V) \parallel (I > 260mA \parallel I < -505mA)$

If Cf goes back to 0, go to discharge

If the next state condition has not been satisfied, stay in the same state
